DESCRIPTION

The Router Delay Simulator with long data delays(RDS-LDD) allows DCE to DTE connections at data rates up to 5Mbps while simulating network delays. The user selectable delays are for bi-directional data and range from 10 milliseconds(mS) to approximately 2560 mS, in 10 mS increments. The RDS-LDD allows users to test and pre-configure critical DTE equipment such as Routers (with software applications) along with an attached modem, digital service unit(DSU) or other network DTE access device for reliable network operation while simulating additional network delay times.

The RDS-LDD has individual data interfaces that allow V.35, RS-530, RS-422/449, RS-232, X.21, TTL and HSSI serial connections for both DCE and DTE interfaces. The data interfaces may also be mix and matched such as V.35-to-RS-530 connections.

The RDS-LDD has status LED's for each attached device which allows the user to visually confirm the presence of control signals.

Installation is fast and simple by setting the external dip switches for external clock mode, CTS control and the data delay time.

The RDS-LDD uses state of the art digital CMOS technology to provide a feature filled product at an affordable price. The units design offers a field programable gate array(FPGA) for fast customer specified changes.

The RDS-LDD is housed in a sturdy metal enclosure and operates on 110/220VAC.

The unit has a three year warranty and a 24 hour turnaround on warranty repairs.
