

PKT-GEN LOAD TESTING

Example: The Wanraptor Network Emulator has a new feature is called, "PKT-GEN" and will generate lots of UDP traffic with selectable packet sizes. This test case show Simplex UDP Traffic sent to multiple LAN ports configured at 1Gbps and 64byte packets.

Example: WANRAPTOR LAN PORTS ENP101 F0-F4

Simply Create four TX only PKT-GEN test cases sending 64byte packet sizes. Set the TX Rate to 1Gbps for each test case. Then turn on each of the four TX only test cases. This will generate four separate ports of 1Gbps traffic (4Gbps Total) of UDP 64Byte packets to see if your Router or switch can handle full peak loading.
